

Human face recognition

Group 1: Sarah Manderschied, Lejla Mesic, Emilia Thiel, Sera Kaplan

Tutor: Hannah Winter

Supervisor: PD Dr. Karl Rohr, Dr. Leonid Kostrykin

What is human face recognition

A multitude of applications

→ Face recognition used for:

- security systems
- authentication for banking, mobile phone
- law enforcement

Project aim

→ Creating a program in python in order to identify each person

The data set

- Yale Face Database of human faces
- 165 images from 15 subjects - 11 images per subject
- GIF files
- grayscale images normalized by size (320x243 pixels)

The data set

→ challenge: finding the best pattern, while...

The data set

emotion: sad

Table of contents

01 Z-TRANSFORMATION

02 PCA

03 k-NN

04 ADDITIONAL IMPLEMENTATIONS

05 MILESTONES

z-transformation

DEFINITION

- before: picture \rightarrow vector
- transforms discrete functions
- centering and scaling data

$$Z = \frac{X - \mu(X)}{\sigma(X)}$$

z-transformation

DEFINITION

- before: picture \rightarrow vector
- transforms discrete functions
- centering and scaling data

$$Z = \frac{X - \mu(X)}{\sigma(X)}$$

z-transformation

DEFINITION

- before: picture \rightarrow vector
- transforms discrete functions
- centering and scaling data

$$Z = \frac{X - \mu(X)}{\sigma(X)}$$

z-transformation

DEFINITION

- before: picture \rightarrow vector
- transforms discrete functions
- centering and scaling data

$$Z = \frac{X - \mu(X)}{\sigma(X)}$$

z-transformation

USE FOR US

- investigation of system properties
- basis for PCA

standardization of pixel values

PCA

MAIN GOAL: REDUCING DIMENSIONS TO MOST INFORMATIVE

- elimination of redundant covariance
- numbers of dimension: number of intensity values per picture

MEANING FOR PROJECT

- identifying most variable feature and removing it
reducing dimension → program is faster

k-NN (k-nearest neighbors algorithm)

WHAT IS k-NN ALGORITHM?

- Classifies unknown data points by finding the most common class among k closest examples
- simple and effective for classification tasks
- k is a number of neighbors that will be considered
- k can be any integer number, chosen experimentally

k-NN (k-nearest neighbors algorithm)

k-NN ON IMAGE PROCESSING

- data points represent images of faces
- images to vectors of numbers
- searches images with closest face-features under euclidean distance
- facial landmarks are used as those features

k-NN (k-nearest neighbors algorithm)

FACIAL LANDMARKS

k-NN (k-nearest neighbors algorithm)

k-NN FOR HUMAN FACE RECOGNITION

1. use our given dataset
2. split the dataset into training and testing set
3. training
4. testing

k-NN (k-nearest neighbors algorithm)

CHALLENGES USING k-NN

1. curse of dimensionality
2. imbalance classes
3. scalability
4. sensitivity to parameter k
5. feature quality

k-NN (k-nearest neighbors algorithm)

OTHER CLASSIFIERS

1. Support Vector Machines (SVMs)
2. Neuronal Networks (CNN)

k-NN (k-nearest neighbors algorithm)

BUT...

k-NN (k-nearest neighbors algorithm)

ADVANTAGES OF k-NN

- Non-parametric
- simple
- robust to noise
- interpretability

Additional Implementations

- LDA instead of PCA
- noise reduction at the beginning
- comparison with packages
- Other classifiers

Evaluation

accuracy: $\text{rightly detected images} / \text{total number of images}$

comparison with other programs/ methods → time & accuracy

comparison accuracy of our program with state-of-the-art technology
